chapter-0 Introduction

- HTML - Hyper text markup language
- `<head>` `</head>` → tags [metadata]
- HTML is language of web

chapter-1 Our First Website

- `index.html` File presents that web starts from first page
- ! → E-mate abbreviation

* A Basic HTML page

`<!DOCTYPE html>` → specify it is HTML5 docu...
`<html>` → root of an HTML page
`<head>` → contains page metadata
`<title>` Pallavi's website `</title>` → title
`</head>`
`<body>` → main body of page
`<h1>` This is heading `</h1>` → heading tag
`<p>` My paragraph `</p>` → paragraph tag
`</body>` → closing body tag
`</html>`

A tag is container for either content or other HTML tags

- In body

`<p> lorem 30 </p>`

↳ It will give 30 words paragraph provided by live server

* Imp notes:-

- ① Head and body tags are children of HTML tag.
- ② most of tag has opening & closing tags and content in between.
- ③ Some HTML tag do not have any content
`<hr>` → used to draw horizontal line
- ④ We can use .htm or .html extensions to save the file ↳ sometime it never detect by browser
- ⑤ You can use *Inspect Element* or *View page source* option from chrome to look into a website's HTML code.

* HTML = start tag + Content + closing tag

* Comments in HTML :- (ctrl + /)

- text that should not be parsed or show on page

`<!-- HTML comment -->`

- HTML is case insensitive language

`<P>` This is paragraph `</p>` → no error

Chapter 4 practice set

① Inspect your fav. website & change something in it?

②

③

chapter-2

Basic HTML Tags

* HTML element :-

everything from starting to ending

<body> → opening tag

→ content ←

</body> → closing tag

* HTML Attributes :-

- used to add more information corresponding to an HTML tag

Ex:-

anchor tag

go to harry's website

href attribute

- We can use single or double quote in attribute

* Heading tag :-

- used to mark headings in html, from h₁ to h₆ headings

- h₁ → most important heading

- we should not use heading for to make it thick or bold

* Paragraph tag :-

- This tag used to add paragraph in web page

- Ex <p> This is a paragraph </p>

DATE / /

* Anchor tag:-

- Anchor tag used to add links in existing content inside an HTML page.
- `<a href = "https://google.com">click</a>`
↳ anchor tag

* Img tag:-

- used to add images in web page
- `<img src src = "image.Jpg">`
relative url of image

* Bold, Italic and underline tags:-

`<b> This is bold line </b>`

`<i> This is italic line </i>`

`<u> This line has underline </u>`

* br tag:-

- The br tag is used to create line break in HTML document

* Big and small tags:-

- We can make a text bit longer & a bit smaller using big & small tags respectively.

* hr tag

- used to get a horizontal line in web page

* Subscript and superscript tags:-

`<p> CO <sub> 2 </sub> </p>`

→ CO₂

PAGE No. _____
DATE ____/____/____

2] `<p> a<sup>2</sup> + bx + c </p>`
 $\rightarrow a^2 + bx + c$

* pre tag :-

- HTML always ignores extra space and new-line in order to displaying a piece of text as it is, we use pre tag.

It print as
it is, some
lines, some
spaces
within

```
<pre>
    #include <iostream>
    using namespace std;
    int main ( ) {
        int a = 10 ;           return 0;
        cout << a << endl;    }
</pre>
```

Practice set Chapter 2

→ practice.html

chapter 3 Creating Page Layout

— 2] `<main> main content </main>`
 1] `<header> </header>`
 3] `<Footage> <Footer> </Footer>`

* ① We add nav tag inside header

* ② Inside main tag we insert following tags

PAGE No. / /
DATE / /

< main >
< section > → A page section
< article > → A self continued content
< aside > → Content aside from Content (eg. Ads)
< /main >

* Link Attributes :-

- 1] click here
- 2]
click here
↳ due to '_main' web open in new tab after clicking

* Div tag :-

- div tag is often used as a container for other elements
- div is block level element
↳ always takes full width

* Span tag :-

- span is an inline container
↳ take as much as width necessary

Chapter --4

Lists, Tables and Forms

* Lists :-

① Underordered list :- `<ul></ul>`

```
<ul>
<li> Pallavi </li>
<li> Arjun </li>
</ul>
```

=>

• Pallavi
• Arjun

Live server

`<ul type = "square"> </u>`

↳ it will give square

■ Pallavi

(but no need of these as it is duplicate when we add CSS)

② Ordered List `<ol></ol>`

```
<ol>
<li> Pallavi </li>
<li> Arjun </li>
</ol>
```

=>

1. Pallavi
2. Arjun

`<ol type = "I"> </ol>`

↳ it give list in roman numbers

I. Pallavi
II. Arjun

* Tables :-

- `<table> </table>`

PAGE No.
 DATE
 / /

- table tag is used to define table tag in HTML

- 1] tr tag : used to display table row
- 2] td tag : used to display table data
- 3] th tag : table header

→

```
<div>
  <table>
    <th> </th>
    <tr> </tr>
      <td> </td> <tr>
    </table>
  </div>
```

→ in laptop

→ heading of table

- 4] caption tag :- caption for table
- 5] thead tag :- used to refer head of table
- 6] tbody tag :- body part is nothing but part expect head part

* Colspan attribute :-

- take (2, 3..... as we want) columns
- It is used in <th> tag

- <th colspan = "2"> </th>

→ it will space of 2 column

* rowspan

→ takes width of given no. of rows

→ <th rowspan = "4"> </th>

used to collect input from user

NAME	
DATE	/ /

* HTML Forms :-

- HTML Form is used to collect input from user. [`<form action="form.php"></form>`]
- There are different form element for different kinds of user input.

→ input element :-

It can be type of text, checkbox, button and submit, & radio button. We also have a 'file' type.

① id :- It is unique identifiers (which assign to only one thing)
↳ a labeling ←

② class :- we can add as many as tag in single class

③ name :- In backend, this or tags are identify by it's name

→ textarea element :-

Defines multiline text input columns & rows attributes can be used to size textarea

→ select element :-

- defines a drop down list
- we can also use option tag to create options.

- YT give option of embeded by which can watch yt video & other website also on our website.

* Video embedded:- ing :-

We can make other website or videos to embed on our website.

```
<iframe src = "http://www.bing.com"
width = "125px" > </iframe>
```

→ this website embed on our website

- video attributes:-

- for normal video
- ① Controls → To play video / stop / all controls
 - ② width → To adjust width of video
 - ③ autoplay → play after coming cursor on video Play automatically
 - ③ Loop → play after finished video

Chapter 5 Search Engine Optimization

* Types of SEO

- 1] On page SEO
- 2] Off page SEO

* HTML SEO

HTML developers can implement SEO using following techniques:

1] Set title very nice & to the point

2] Set the meta description

`<meta name = " description " content=" ..... " >`

(in head before title)

3] Set a nice url slug

`http://www.GEO. What is url SEO?`

↓
This is url slug which give info about page

4] use meta keywords → but now considered as spam

5] Set meta author tag

`<meta name="author". content = "... " >`

6] Set a Favicon

link → Favicon → entre.

[Favicon.io] → website help to create Favicon

7] Compress images & other resources

- if image is so small in size but taking 100 mb memory we can compress it.

→ `<link rel = "shortcut icon" href = "Favicon.seo" type = "image" >`

↓
Favicon generator website

8] Compress HTML, CSS or javascript

↳ websites available

* for adding video's

<video src="vid.mp4"> video is here
</video>

attributes to play & control video

① Control

<video src="vid.mp4" controls >
</video>

② width (height adjust) ← similarly

③ autoplay

④ Loop

*
